

"DaMe" - electronic health care in Austria

DATAKOM AUSTRIA is promoting its digital communications system "DaMe" - Datenaustausch für Mediziner (data exchange for the medical profession), www.datakom.at/dame. The electronic transmission facilitates diagnosis and therapy while reducing costs. Equipped with new features, the secure transmission service for medical findings "connect.med.secure" is also available now for Austrian physicians.

Security for medical data

DaMe makes for easy, smooth, and above all secure transmission and processing of patient data, doctor's reports, and laboratory results. Incoming findings are accepted and automatically allocated to the right patient.

"DaMe" is also based on the principle of highest priority for security. The standard technology meets highest data protection requirements and complies with the new digital signature law. The reliability of electronic transmission using the encryption technology of DATAKOM, the leading certification authority, was also substantiated.

MOS - Medicine Online Service

With the "click of a mouse" physicians have access to information on events and congresses, contributions relating to health policy and the medical profession, therapy guidelines, and contributions from pertinent international literature. An interactive area, which also serves as a forum for exchanging of experience, placing small ads, and collecting addresses. "MOS is an online service tailored precisely to meet the requirements of the health sector", says DATAKOM expert Peter Uher. For this reason, the Austrian Chambers of Physicians in Salzburg, Upper Austria, and Vienna have decided to provide this electronic service brought to you by DATAKOM to regional physicians.
